

## Workshop on Climate Risk Assessment- Agriculture and Built Environment

Join us for a **participatory workshop** to identify key risks to the agricultural sector and built environment in environment in the White Carpathians and their foothills (in the Czech Republic) under the lens of climate change. The workshop will enable the identification of **main challenges** and **potential points of improvement** in risk management.

We invite the participation of sectoral experts and public servants working in the Zlín region. Observers from neighboring countries are also welcome to contribute to the exchange of best practices.

This workshop is organized as part of the **IMPETUS project**, in particular by Eurac Research (Italy), who is coordinating the demonstration site in the **mountain biogeographical region**. IMPETUS focuses on testing innovative solutions, engaging with local communities, and fostering the exchange of best practices regionally and across Europe to enhance climate resilience.
